Flood Defences

Site is not in an area benefitting from flood defences.

Flood Warning Area

The EA Flood Warning Service is not available at this site.

Aitigation / FRA Requirements

al risk predicted at this site is negligible.

Mitigation - Surface Water Drainage All planning applications need a flood risk assessment and/or drainage strategy with a completed SuDS/Drainage proforma. Developments should apply the Sustainable Drainage Hierarchy set out in Policy SI 13 of the London Plan. Ground investigations are required to confirm whether infiltration SuDS are suitable.

SITE ASSESSMENT - Taverner House and Telephone Exchange, Birkenhead Avenue

SEWER **Risk Assessment**

• The site falls within a postcode area, where 242 sewer flood incidents have been reported.

• The site is assumed to be served by separate surface water and foul sewer networks, given their proximity to the site.

Figure 5 - Thames Water Sewer Flood Map

Mitigation Requirements

• Applicant must consult with TWUL to confirm if the development site has historically flooded. TWUL must agree to any proposed sewer connections.

• Where historic flooding has occurred, the applicant must show how this risk will be managed for the lifetime of the development.

The site is classified as having < 25% susceptibility to groundwater flooding. The site is mostly underlain by London Clay Formation bedrock geology and Langley Silt Member superficial deposits.

GROUNDWATER

Risk Assessment

Figure 6 - Areas Susceptible to Groundwater Flooding Map **Mitigation Requirements** • Applicant should carry out a screening study (as a minimum) to establish if there

are any subterranean flood risk issues that may require further investigation. If there is a potential level of impact, mitigation actions must be proposed. • Must be prepared by a chartered professional or specialist.

Risk Assessment This site is at high risk of flooding from the reservoirs based on the EA reservoir wet day extent.

Figure 7 - Outline Reservoir Flood Map

• Propose appropriate and proportionate risk management measures. • A suitable emergency response plan should be put in place, including an emergency warning system in the event of a reservoir flooding incident. Local Authority Emergency Planning Officers must be consulted to create a reservoir failure emergency and evacuation plan

PLANNING CONSIDERATIONS Safety of Development

A. Can the development be future proofed for climate change considerations?

• Yes. See SFRA - Level 2 Report Section 4 mitigation requirement number 4.2 for the required flood resistant / resilient building stipulations.

B. Can the development be designed safe throughout its lifetime without increasing flood risk elsewhere?

• Yes. The development must use surface water drainage techniques to manage surface water runoff onsite through above ground SuDS and / or below ground attenuation. Green drainage infrastructure should be prioritised to provide wider ecological / biodiversity benefits as per London Plan Policy SI 13.

See SFRA - Level 2 Report Section 4 mitigation requirement number 4.3 for compensatory flood storage stipulations.

C. What is the cumulative impact of the development land use change and will flood risk increase?

• The development land use will change from 'Less Vulnerable' to 'More Vulnerable'.

• The site is predominantly covered by impermeable areas. This offers an opportunity to improve flood attenuation through the new development.

• Development must mitigate any increase in impermeable area to the site with flood plain compensation and runoff storage to prevent any increase in flood risk. An increase in impermeable area coverage on site will increase surface water runoff and flood risk if not managed properly.

D. How can the development reduce risk overall?

• Direct development away from northwestern areas of the site.

• Safe access and egress routes should be directed to the southwest of the site towards Tithe Barn Close where there is a lower risk of flooding.

• By complying with Policy DM4 of the Kingston Core Strategy (2012) through including SuDS to ensure that the development is not vulnerable to surface water, sewer and groundwater flooding and to reduce the overall level of flood risk in the borough and beyond.

• By complying with SFRA - Level 2 Report Section 4 mitigation requirement numbers 4.2, 4.3 and 4.5.

E. Will development require a flood risk permit/watercourse consent?

• No. The site is not located within 8m of a Main River or ordinary watercourse.

F. Can the site pass the Exception Test?

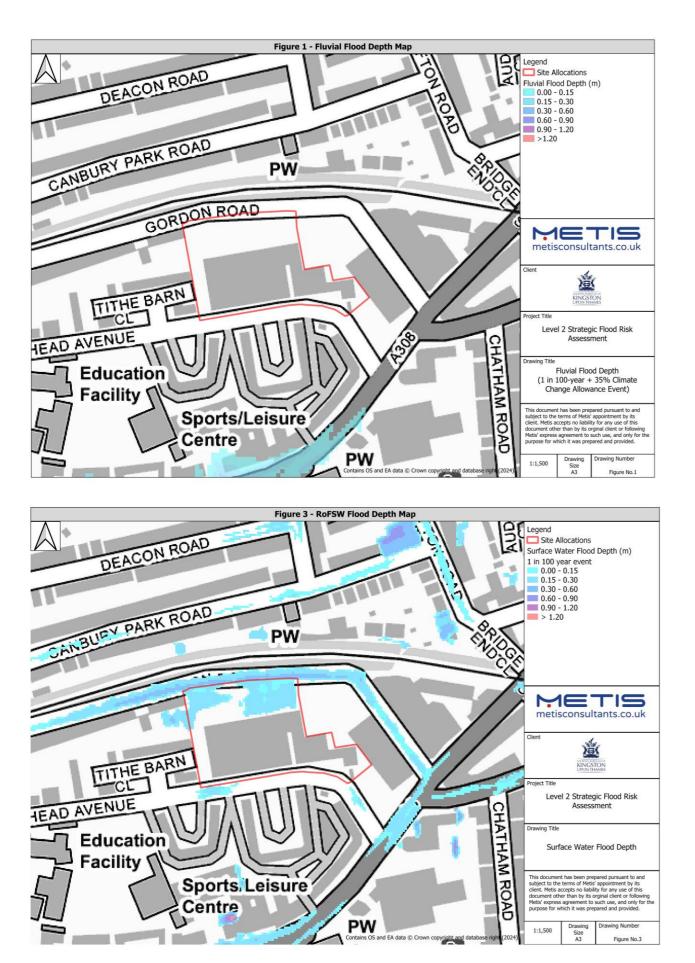

• Yes. The Exception Test is required for this site as 20.57% of the site area is in Flood Zone 3a (surface water) and the proposed vulnerability classification is 'More Vulnerable'.

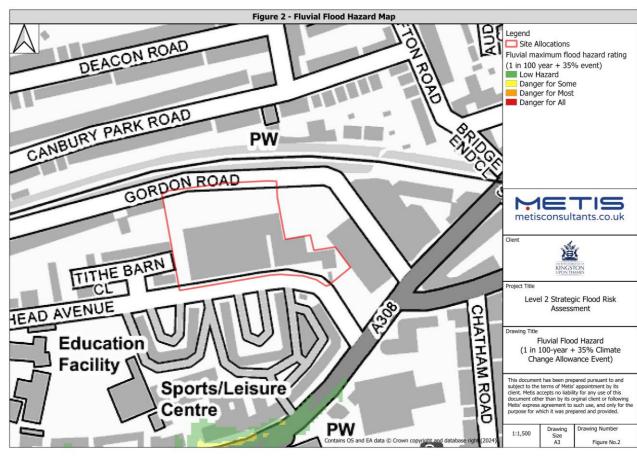

• This can be passed by making the site safe throughout its lifetime without increasing flood risk elsewhere (see questions A, B and C). The site could also reduce flood risk overall with appropriate SuDS and flood storage compensation measures implemented (see 'Mitigation - Flood Risk Requirements' and 'Mitigation - Surface Water Drainage' boxes).
